

Lecture 2. Single-particle propagator in a uniform system

- General properties of the single particle Green's function.
- Free propagator in the infinite matter. Spectral functions.
- Diagrammatic rules. Examples.
- Self-energy. Dyson Equations.
- Quasi-particle approximation.
- Beyond Hartree-Fock. Second order calculation of the self-energy.
-

The Single particle propagator a good tool to study single particle properties

Not necessary to know all the details of the system (the full many-body wave function) but just what happens when we add or remove a particle to the system.

It gives access to all single particle properties as :

- momentum distributions
- self-energy (Optical potential)
- effective masses
- spectral functions

Also permits to calculate the expectation value of a very special two-body operator: the Hamiltonian in the ground state.

Mathematically : time-ordered propagator

$$g(\alpha, \beta; t, t') = -\frac{i}{\hbar} \langle \Psi_0^N | T [a_{\alpha H}(t) a_{\beta H}^\dagger(t')] | \Psi_0^N \rangle$$

- * Expectation value with respect to the exact ground state of the system of N particles.
- * Defined in the Heisenberg picture
- * The time ordering operator T allows to consider both particle (add a particle to the system) and hole (remove a particle from the system) propagation. With the help of step functions, the time ordering operator is defined like *

$$T [a_{\alpha n}(t) a_{\beta n}^{\dagger}(t')] = \theta(t-t') a_{\alpha n}(t) a_{\beta n}^{\dagger}(t') \\ - \theta(t'-t) a_{\beta n}^{\dagger}(t') a_{\alpha n}(t)$$

- * this definition includes a sign change when the two fermion operators are interchanged.
- * The idea is to put operators with earlier times to the right, just to act first.
- * $| \alpha \rangle$ are a suitable basis of single particle states. $| \vec{k}, u_s, u_t \rangle$ for an infinite system

$|\Psi_0^N\rangle$ is the normalized Heisenberg ground state, which usually we do not know! ▽

$$\hat{H} |\Psi_0^N\rangle = E_0^N |\Psi_0^N\rangle$$

In the Heisenberg picture, the single-particle operators $a_{dH}(t)$ and $a_{dH}^\dagger(t)$ are

$$a_{dH}(t) = e^{i \frac{\hat{H}t}{\hbar}} a_d e^{-i \frac{\hat{H}t}{\hbar}}$$

$$a_{dH}^\dagger(t) = e^{i \frac{\hat{H}t}{\hbar}} a_d^\dagger e^{-i \frac{\hat{H}t}{\hbar}}$$

$$g(\alpha, \beta; t-t') = -\frac{i}{\hbar} \left\{ \theta(t-t') e^{\frac{i}{\hbar} E_0^N(t-t')} \langle \Psi_0^N | a_\alpha e^{-\frac{i}{\hbar} H(t-t')} a_\beta^\dagger | \Psi_0^N \rangle \right. \\ \left. + \theta(t'-t) e^{\frac{i}{\hbar} E_0^N(t'-t)} \langle \Psi_0^N | a_\beta^\dagger e^{-\frac{i}{\hbar} H(t'-t)} a_\alpha | \Psi_0^N \rangle \right\}$$

Interpretation for $t > t'$

$$g(\alpha, \beta; t-t') = -\frac{i}{\hbar} \langle \Psi_0^N | e^{\frac{i}{\hbar} \hat{H} t} a_\alpha e^{-\frac{i}{\hbar} \hat{H} t} e^{\frac{i}{\hbar} \hat{H} t'} a_\beta^\dagger e^{-\frac{i}{\hbar} \hat{H} t'} | \Psi_0^N \rangle$$

$t > t'$

$e^{-\frac{i}{\hbar} \hat{H} t'} | \Psi_0^N \rangle$ ground state at t'

$a_\beta^\dagger e^{-\frac{i}{\hbar} \hat{H} t'} | \Psi_0^N \rangle$ a particle in the state β is added at $t=t'$

$e^{-\frac{i}{\hbar} \hat{H} (t-t')} a_\beta^\dagger e^{-\frac{i}{\hbar} \hat{H} t'} | \Psi_0^N \rangle$ the system evolves up to t .

$$\left(a_\alpha^\dagger e^{-\frac{i}{\hbar} \hat{H} t} | \Psi_0^N \rangle \right)^\dagger = \langle \Psi_0^N | e^{\frac{i}{\hbar} \hat{H} t} a_\alpha$$

one particle in the state α added at time t

therefore, for $t > t'$, $g(\alpha, \beta; t-t')$ gives the probability amplitude to find the system at time t with an additional particle in the state $|\alpha\rangle$ when at time $t' \leq t$ a particle in the state $|\beta\rangle$ was added to the system.

Inserting the identity of the $N+1$ and $N-1$ particle systems in the definition of $g(\alpha, \beta; t-t')$

$$g(\alpha, \beta; t-t') = -\frac{i}{\hbar} \left\{ \theta(t-t') \sum_m e^{\frac{i}{\hbar} (E_0^N - E_m^{N+1})(t-t')} \right.$$

$$\langle \psi_0^N | a_\alpha | \psi_m^{N+1} \rangle \langle \psi_m^{N+1} | a_\beta^\dagger | \psi_0^N \rangle$$

$$- \theta(t'-t) \sum_n e^{\frac{i}{\hbar} (E_0^N - E_n^{N-1})(t'-t)} \langle \psi_0^N | a_\beta^\dagger | \psi_n^{N-1} \rangle \langle \psi_n^{N-1} | a_\alpha | \psi_0^N \rangle$$

* The propagator depends only on the time difference
→ make a Fourier transform

* We have used the knowledge of the spectrum of the system with $N+1$ and $N-1$ particles

$$\hat{H} |\psi_m^{N+1}\rangle = E_m^{N+1} |\psi_m^{N+1}\rangle$$

$$\hat{H} |\psi_n^{N-1}\rangle = E_n^{N-1} |\psi_n^{N-1}\rangle$$

$$g(\alpha, \beta; E) = \int_{-\infty}^{\infty} d(t-t') e^{\frac{i}{\hbar} E(t-t')} g(\alpha, \beta; t-t') =$$

$$= \int_{-\infty}^{\infty} d(t-t') e^{\frac{i}{\hbar} E(t-t')} \left[-\frac{i}{\hbar} \left\{ \theta(t-t') \sum_m e^{\frac{i}{\hbar} (E_0^N - E_m^{N+1})(t-t')} \right. \right. \\ \left. \left. < \psi_0^N | a_\alpha | \psi_m^{N+1} > < \psi_m^{N+1} | a_\beta^\dagger | \psi_0^N > \right. \right. \\ \left. \left. - \theta(t'-t) \sum_n e^{\frac{i}{\hbar} (E_0^N - E_n^{N-1})(t'-t)} < \psi_0^N | a_\beta^\dagger | \psi_n^{N-1} > < \psi_n^{N-1} | a_\alpha | \psi_0^N > \right\} \right]$$

introducing the integral representation of the step function

$$= \int_{-\infty}^{\infty} d(t-t') e^{\frac{i}{\hbar} E(t-t')} \left[-\frac{i}{\hbar} \left\{ -\frac{1}{2\pi i} \int_{-\infty}^{\infty} dE' \frac{e^{-iE'(t-t')}}{E' + i\eta^+} \right. \right. \\ \left. \left. \sum_m e^{\frac{i}{\hbar} (E_0^N - E_m^{N+1})(t-t')} < \psi_0^N | a_\alpha | \psi_m^{N+1} > < \psi_m^{N+1} | a_\beta^\dagger | \psi_0^N > \right. \right. \\ \left. \left. - \left(-\frac{1}{2\pi i} \int_{-\infty}^{\infty} dE' e^{-\frac{i}{\hbar} E'(t'-t)} \right) \sum_n e^{\frac{i}{\hbar} (E_0^N - E_n^{N-1})(t'-t)} < \psi_0^N | a_\beta^\dagger | \psi_n^{N-1} > < \psi_n^{N-1} | a_\alpha | \psi_0^N > \right\} \right]$$

changing the order of integration

$$- (-i) \int_{-\infty}^{\infty} \frac{dE'}{2\pi i} \int_{-\infty}^{\infty} d\left(\frac{t-t'}{t}\right) \sum_m \frac{e^{-i[E' - (E_0^N - E_m^{N+1}) - E] \frac{(t-t')}{t}}}{E' + i\eta^+} \langle \psi_0^N | a_x | \psi_m^{N+1} \rangle \langle \psi_m^{N+1} | a_p^+ | \psi_0^N \rangle$$

$$+ (-i) \int_{-\infty}^{\infty} \frac{dE'}{2\pi i} \int_{-\infty}^{\infty} d\left(\frac{t-t'}{t}\right) \sum_n \frac{e^{-i[-E' + (E_0^N - E_n^{N-1}) - E] \frac{(t-t')}{t}}}{E' + i\eta^+} \langle \psi_0^N | a_p^+ | \psi_n^{N-1} \rangle \langle \psi_n^{N-1} | a_x | \psi_0^N \rangle$$

$$= - (-i) \int_{-\infty}^{\infty} \frac{dE'}{2\pi i} 2\pi \sum_m \frac{\delta(E' - (E_0^N - E_m^{N+1}) - E)}{E' + i\eta^+} \langle \psi_0^N | a_x | \psi_m^{N+1} \rangle \langle \psi_m^{N+1} | a_p^+ | \psi_0^N \rangle$$

$$- i \int_{-\infty}^{\infty} \frac{dE'}{2\pi i} 2\pi \sum_n \frac{\delta(-E' - (E_0^N - E_n^{N-1}) - E)}{E' + i\eta^+} \langle \psi_0^N | a_p^+ | \psi_n^{N-1} \rangle \langle \psi_n^{N-1} | a_x | \psi_0^N \rangle$$

The presence of the δ allows to perform the integral on dE' , and one gets

$$g(\alpha, \beta; E) = \sum_m \frac{\langle \psi_0^N | a_\alpha | \psi_m^{N+1} \rangle \langle \psi_m^{N+1} | a_\beta^\dagger | \psi_0^N \rangle}{E + E_0^N - E_m^{N+1} + i\eta^+} - \sum_n \frac{\langle \psi_0^N | a_\beta^\dagger | \psi_n^{N-1} \rangle \langle \psi_n^{N-1} | a_\alpha | \psi_0^N \rangle}{-E + E_0^N - E_n^{N-1} + i\eta^+}$$

and finally

$$g(\alpha, \beta; E) = \sum_m \frac{\langle \psi_0^N | a_\alpha | \psi_m^{N+1} \rangle \langle \psi_m^{N+1} | a_\beta^\dagger | \psi_0^N \rangle}{E + E_0^N - E_m^{N+1} + i\eta^+} + \sum_n \frac{\langle \psi_0^N | a_\beta^\dagger | \psi_n^{N-1} \rangle \langle \psi_n^{N-1} | a_\alpha | \psi_0^N \rangle}{E - (E_0^N - E_n^{N-1}) - i\eta^+}$$

This is the Lehmann representation

Removing the complete set of $|N+1\rangle$ eigenstate/
 and $|\Psi_n^{N-1}\rangle$ one expresses the Green function
 as an expectation value on the ground state

$$g(d, p; E) = \langle \Psi_0^N | a_d \frac{1}{E - (\hat{H} - E_0^N) + i\eta} a_p^\dagger | \Psi_0^N \rangle$$

$$+ \langle \Psi_0^N | a_p^\dagger \frac{1}{E - (E_0^N - \hat{H}) - i\eta} a_d | \Psi_0^N \rangle$$

Occupation of the single-particle state α

$$n(\alpha) = \langle \Psi_0^N | a_\alpha^\dagger a_\alpha | \Psi_0^N \rangle = \sum_n |\langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle|^2$$

$$= \int_{-\infty}^{\epsilon_F} dE \sum_n |\langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle|^2 \delta(E - (E_0^N - E_n^{N-1}))$$

$$= \int_{-\infty}^{\epsilon_F} dE S_n(\alpha, E) = \frac{1}{\pi} \int_{-\infty}^{\epsilon_F} dE \operatorname{Im} g(\alpha, \alpha; E)$$

$$= \oint \frac{dE}{2\pi i} g(\alpha, \alpha; E)$$

Several ways
to calculate $n(\alpha)$

... ..

similar procedure for the disoccupation

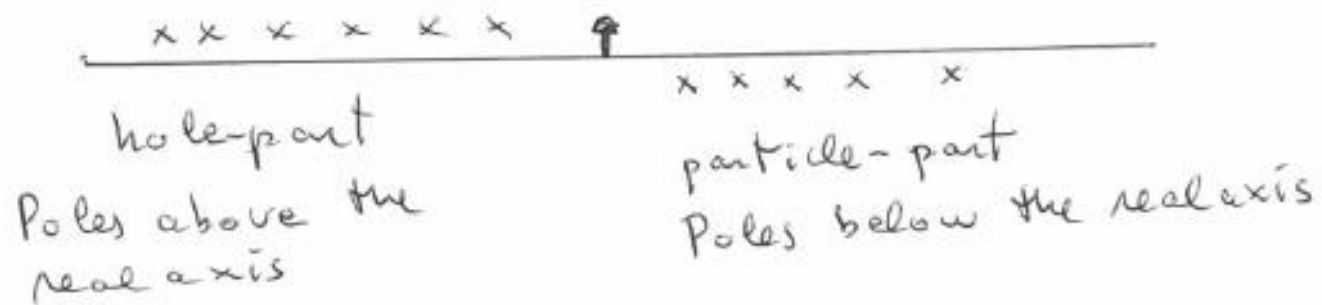

$$\begin{aligned}
 d(\alpha) &= \langle \Psi_0^N | a_\alpha a_\alpha^\dagger | \Psi_0^N \rangle = \sum_m |\langle \Psi_m^{N+1} | a_\alpha^\dagger | \Psi_0^N \rangle|^2 \\
 &= \int_{\epsilon_F}^{\infty} dE \sum_m |\langle \Psi_m^{N+1} | a_\alpha^\dagger | \Psi_0^N \rangle|^2 \delta(E - (E_m^{N+1} - E_0^N)) \\
 &= \int_{\epsilon_F}^{\infty} dE S_F(\alpha, E) = -\frac{1}{\pi} \int_{\epsilon_F}^{\infty} dE \operatorname{Im} g(\alpha, \alpha; E)
 \end{aligned}$$

$$\begin{aligned}
 n(\alpha) + d(\alpha) &= 1 = \langle \Psi_0^N | a_\alpha^\dagger a_\alpha + a_\alpha^\dagger a_\alpha | \Psi_0^N \rangle \\
 &= \langle \Psi_0^N | \{a_\alpha^\dagger, a_\alpha\} | \Psi_0^N \rangle = 1
 \end{aligned}$$

$$\text{occupation} + \text{disoccupation} = 1$$

The Green's function has simple poles
at the excitation energies of the $(A-1)$
system (hole-part), and of the $(A+1)$
system (particle-part)

Complex E-plane

For a continuous excitation spectrum
becomes a cut

Complex E-plane

$$g(\alpha, \alpha; E) = \sum_m \frac{\langle \Psi_0^N | a_\alpha | \Psi_m^{N+1} \rangle \langle \Psi_m^{N+1} | a_\alpha^\dagger | \Psi_0^N \rangle}{E + E_0^N - E_m^{N+1} + i\eta^+} \\ + \sum_n \frac{\langle \Psi_0^N | a_\alpha^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle}{E - E_0^N + E_n^{N-1} - i\eta^+}$$

we $\frac{1}{E \pm i\eta} = P \frac{1}{E} \mp i\pi \delta(E) \Rightarrow$

$$S_n(\alpha, E) = \frac{1}{\pi} \text{Im} g(\alpha, \alpha, E)$$

$$E < \cancel{E} = E_0^N - E_0^{N-1}$$

$$= \sum_n |\langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle|^2 \delta(E - (E_0^N - E_n^{N-1}))$$

$S_n(\alpha, E)$ gives the probability distribution to take out a particle in the state $|\alpha\rangle$ from the ground state $|\Psi_0^N\rangle$ leaving the resulting $N-1$ system ~~with~~ in a state $|\Psi_n^{N-1}\rangle$ with energy $E_n^{N-1} = E_0^N - E$

$$\hat{O}_1 = \sum_{\alpha\beta} \langle \alpha | O_1 | \beta \rangle a_\alpha^\dagger a_\beta$$

Expectation value of \hat{O}_1 in the ground state:

$$\langle \Psi_0^N | \hat{O}_1 | \Psi_0^N \rangle = \sum_{\alpha\beta} \langle \alpha | O_1 | \beta \rangle n_{\alpha\beta}$$

where $n_{\alpha\beta} = \langle \Psi_0^N | a_\alpha^\dagger a_\beta | \Psi_0^N \rangle$

How is related $n_{\alpha\beta}$ and $g(\alpha, \beta; E)$?

$$n_{\beta\alpha} = \oint \frac{dE}{2\pi i} g(\alpha, \beta; E)$$

$$= \int \frac{dE}{2\pi i} e^{iE\eta} g(\alpha, \beta; E)$$

Integral in the complex E plane.

The convergence factor $e^{iE\eta}$ forces to close the contour in the upper part

of the complex E plane

Remember the Lehmann representation

$$g(\alpha, \beta; E) = \sum_m \frac{\langle \Psi_0^N | a_\alpha | \Psi_m^{N+1} \rangle \langle \Psi_m^{N+1} | a_\beta^\dagger | \Psi_0^N \rangle}{E - (E_m^{N+1} - E_0^N) + i\eta}$$

poles in the lower part

$$+ \sum_n \frac{\langle \Psi_0^N | a_\beta^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle}{E - (E_0^N - E_n^{N-1}) - i\eta}$$

poles in the upper part

What are the residues? Pole of order 1

$$\lim_{E \rightarrow (E_0^N - E_n^{N-1}) - i\eta} g(\alpha, \beta; E) (E - (E_0^N - E_n^{N-1}) - i\eta)$$

$$= \langle \Psi_0^N | a_\beta^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle$$

$$\oint \frac{dE}{2\pi i} g(\alpha, \beta; E) = 2\pi i \frac{1}{2\pi i} \sum_i \text{Res} =$$

$$= \sum_n \langle \Psi_0^N | a_\beta^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle$$

$$= \langle \Psi_0^N | a_\beta^\dagger a_\alpha | \Psi_0^N \rangle = n_{\beta\alpha}$$

and as $S_n(\alpha, E) = \frac{1}{\pi} \text{Im} g(\alpha, \alpha; E) =$

$$= \sum_n |\langle \Psi_n^{N-1} | a_\alpha | \Psi_0^N \rangle|^2 \delta(E - (E_0^N - E_n^{N-1}))$$

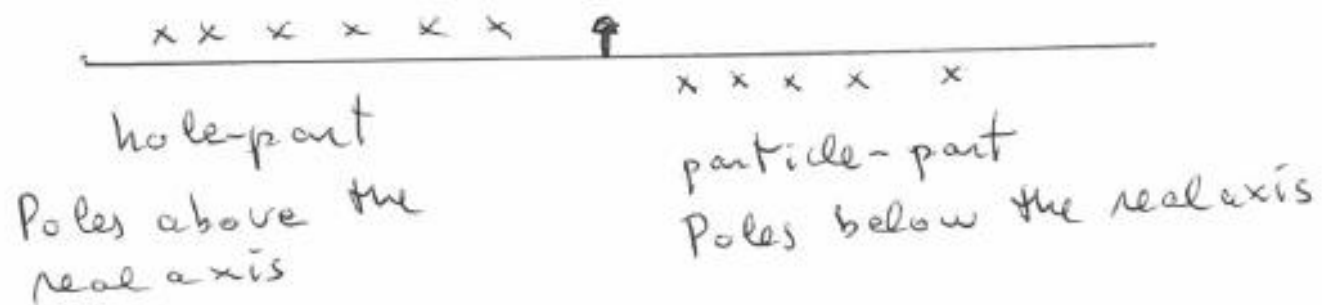

we can write

$$\oint \frac{dE}{2\pi i} g(\alpha, \alpha; E) = \frac{1}{\pi} \int_{-\infty}^{E_F} dE \text{Im} g(\alpha, \alpha; E)$$

$$= \int_{-\infty}^{E_F} S_n(\alpha, E) dE = n_{\alpha\alpha}$$

The Green's function has simple poles
at the excitation energies of the $(A-1)$
system (hole-part), and of the $(A+1)$
system (particle-part)

Complex E-plane

For a continuous excitation spectrum
becomes a cut

Complex E-plane

Free Fermi gas

All k occupied up to k_F

For a uniform system

we take plane waves normalized to volume

$$\frac{1}{\Omega^2} \int d^3 r_1 d^3 r_2 e^{-i \vec{k}_\delta \vec{r}_1} e^{-i \vec{k}_\epsilon \vec{r}_2} V(r_{12}) e^{i \vec{k}_\epsilon \vec{r}_1} e^{i \vec{k}_\theta \vec{r}_2}$$

* At a given order "n" we draw n horizontal lines, and two external points $\uparrow a^\dagger_\beta$ and $\uparrow a_\alpha$ at the bottom at the top

* Now one should join the lines
without finding arrows against \Rightarrow
perform the contractions of Wick's theorem
properly.

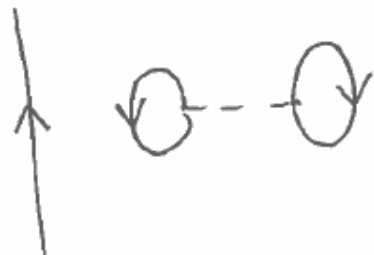

* At order " n " \rightarrow there are n interactions
 $V \Rightarrow$ We have to join $2n+2$ points
 $\Rightarrow 2n+2$ lines $\Rightarrow (2n+1)!$ factors!

* At order " n " we have $4n+2$
creation and annihilation operators

$\Rightarrow (2n+1)$ creation
 $(2n+1)$ annihilation

\Rightarrow In principle I can make $(2n+1)!$
terms all contracted

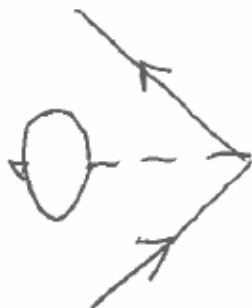

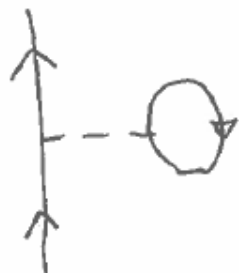

Order $n=1$

"unlinked".

* One needs to separate the pen from the paper.

* Cancelled with the denominator.

"topologically equivalent"

Calculate only one!

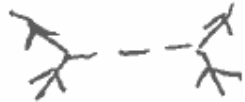

"topologically equivalent"

At order n appear (for each linked diagram) $\times 2^n$ topologically equivalent diagrams. We calculate only one and cancel the factor $\frac{1}{2^n}$ which appear at order " n " due to the potential.

Rules for ig. Order m

- ① Draw all topologically different diagrams with m interaction lines and $2m+1$ $g^{(0)}$ propagators.

to this end:

a) Draw " m " horizontal lines 
with vertices "in" and "out" arrows
plus the two external points

b) Join all vertices starting from the lower one with an in-going and an out-going line at each vertex.

• To visualize if two diagrams are equivalent \Rightarrow try to deform them and see if they look the same.

• There are Feynman diagrams \Rightarrow the arrows in the lines indicate flux of energy and momentum, which are conserved at each vertex.

• The diagrams contain particles and holes

② Assign a label \vec{k}, ω, E at each line (also ω in nuclear systems)

At each line ($g^{(0)}$) corresponds a factor:

$$i g_{\omega \omega'}^{(0)}(\vec{k}, E) = i \delta_{\omega \omega'} \left[\frac{\Theta(|\vec{k}| - k_F)}{E - \frac{\hbar^2 k^2}{2m} + i\eta} + \frac{\Theta(k_F - |\vec{k}|)}{E - \frac{\hbar^2 k^2}{2m} - i\eta} \right]$$

which contains propagation of particles and holes.

③ Assign a matrix element for each interaction. Momentum and energy are conserved at each vertex

$$(-i) \langle \vec{k}_1 \vec{k}_2 | V(r) | \vec{k}_3 \vec{k}_4 \rangle$$

④ Sum over all internal quantum numbers
spin and momenta, $\Omega \int \frac{d^3 k}{(2\pi)^3}$

and energies $\int \frac{dE}{2\pi}$

⑤ Assign a sign $(-1)^F$ where F is
 the number of fermionic loops \Rightarrow fermionic
 lines that close over themselves.

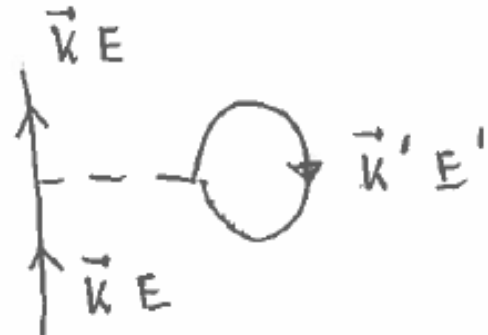

1 fermionic loop

⑥ The integral over the energy of a fermionic non propagating line (starts and ends at the same interaction) should be performed in the upper part of the complex plane

$$\oint \frac{dE}{(2\pi)} g^{(0)}(k, E)$$

(which is in agreement with the receipt for contractions at equal times).

First order diagram

6 operators

3 $g^{(0)}$

linked diagram

* We have taken into account the momentum and energy conservation at each vertex.

* Let's forget the spin and the isospin.

Contribution to $ig(k, E)$

$$i^3 \quad (-i) \quad (-1) \quad g^{(0)}(k, E)$$

one for each $g^{(0)}$ one interaction fermionic loop

$$\sum_{E'} \frac{1}{2\pi} \oint dE' g^{(0)}(k', E') \cdot \langle \bar{k} \bar{k}' | V | \bar{k} \bar{k}' \rangle g^{(0)}(k, E)$$

$$\langle \bar{k} \bar{k}' | V | \bar{k} \bar{k}' \rangle = \frac{1}{\Omega} \int d^3 r V(r)$$

normalization to volume

$$= g^{(0)}(k, E) \left[\underbrace{\frac{\Omega}{(2\pi)^3} \int d^3 k'}_{\sum_{k'}} \frac{1}{2\pi} \oint dE' g^{(0)}(k', E') \frac{1}{\Omega} \int d^3 r V(r) \right] g^{(0)}(k, E)$$

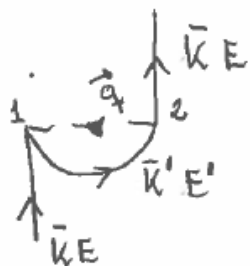

$$\frac{1}{2\pi} \oint dE' \left[\frac{\Theta(k' - k_F)}{E' - \epsilon_{k'} + i\eta} + \frac{\Theta(k_F - k')}{E' - \epsilon_{k'} - i\eta} \right] = \frac{1}{2\pi} 2\pi i \sum \text{Res} = i \Theta(k_F - k')$$

$$\text{Res } g^{(0)}(k', E') = \lim_{E' \rightarrow \epsilon_{k'} + i\eta} (E' - \epsilon_{k'} - i\eta) g^{(0)}(k', E') = \Theta(k_F - k')$$

$$= i g^{(0)}(k, E) \left[\underbrace{\frac{1}{(2\pi)^3} \int d^3 k' \Theta(k_F - k')}_{\rho} \int d^3 r V(r) \right] g^{(0)}(k, E)$$

$$= i g^{(0)}(k, E) \rho \int d^3r V(r) g^{(0)}(k, E) = i g^{(1)}(k, E)$$

dimensional? $\left. \begin{aligned} [g^{(0)}(k, E)] &= \frac{1}{E} \\ [\rho \int d^3r V(r)] &= E \end{aligned} \right\} \frac{1}{E} E \frac{1}{E} = \frac{1}{E}$

Contribution to $i g(k, E)$

$$i^3 (-i) g^{(0)}(k, E) \sum_{k'} \frac{1}{2\pi} \oint g^{(0)}(k', E') dE'$$

$$\langle \bar{k}' \bar{k} | \mathcal{V}(r) | \bar{k} \bar{k}' \rangle$$

\nwarrow left out \downarrow right out \nearrow left in \nwarrow right in

$$\langle \bar{k}' \bar{k} | \mathcal{V}(r) | \bar{k} \bar{k}' \rangle = \frac{1}{\Omega^2} \int d^3 r_1 \int d^3 r_2 e^{-i \bar{k}' \bar{r}_1} e^{-i \bar{k} \bar{r}_2} \mathcal{V}(r_{12}) e^{i \bar{k} \bar{r}_1} e^{i \bar{k}' \bar{r}_2}$$

$$= \frac{1}{\Omega^2} \int d^3 R \int d^3 r e^{-i \bar{k}' (\bar{R} + \frac{\bar{r}}{2})} e^{-i \bar{k} (\bar{R} - \frac{\bar{r}}{2})} \mathcal{V}(r) e^{i \bar{k} (\bar{R} + \frac{\bar{r}}{2})} e^{i \bar{k}' (\bar{R} - \frac{\bar{r}}{2})}$$

$$= \underbrace{\frac{1}{\Omega}}_1 \int d^3 R \cdot \frac{1}{\Omega} \int d^3 r e^{-i (\bar{k}' - \bar{k}) \frac{\bar{r}}{2}} \mathcal{V}(r) e^{i (\bar{k} - \bar{k}') \frac{\bar{r}}{2}}$$

$-i \bar{q} \bar{r}$ $\bar{q} = \bar{k}' - \bar{k}$

$$= \frac{1}{\Omega} \int d^3 r \mathcal{V}(r) e^{-i \bar{q} \bar{r}}$$

$$\frac{1}{2\pi} \oint dE' g^{(0)}(k', E') = i \theta(k_F - k')$$

every thing together \Rightarrow

$$= -i g^{(0)}(k, E) \left[\frac{1}{(2\pi)^3} \int d^3 k' \theta(k_F - k') \int d^3 r \theta(r) e^{-i(\vec{k}' - \vec{k}) \cdot \vec{r}} \right] g^{(0)}(k, E)$$

$$\uparrow + \uparrow - \bigcirc + \uparrow \Rightarrow i g^{(0)}(k, E) +$$

$$i g^{(0)}(k, E) \left[\int d^3 r \theta(r) - \frac{1}{(2\pi)^3} \int d^3 k' \theta(k_F - k') \int d^3 r \theta(r) e^{-i(\vec{k}' - \vec{k}) \cdot \vec{r}} \right] g^{(0)}(k, E)$$

At the moment it is not easy to identify the excitation energies as poles in the denominator,
 \Rightarrow We need to do a Dyson equation \Rightarrow
 an infinite sum of diagrams

Self-energy and Dyson equation

The analysis of the diagrams contributing to the one-body Green's function allows to introduce the concept of self-energy.

Self-energy: Any diagram without external legs, which can be inserted into a propagator line.

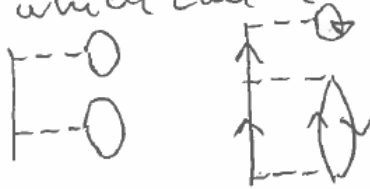

Examples: 

Proper (irreducible) self-energy:

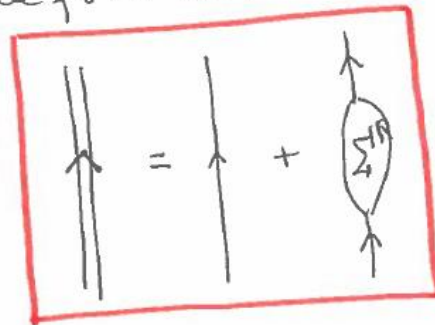

A self-energy part which cannot be broken into two unconnected self-energy parts by removing one propagator line.

Reducible
A self-energy part which can be broken

By definition

This is a Dyson type equation

Diagrammatic equation showing the expansion of a double line into a sum of diagrams with self-energy loops. The first part shows a double line equal to a single line plus a loop with a self-energy insertion Σ^R . The second part shows the same double line equal to a single line plus a series of diagrams with increasing numbers of self-energy loops, indicated by a red dashed line and an ellipsis.

$$\Rightarrow \text{Diagrammatic equation}$$

$$ig(k, E) = ig^{(0)}(k, E) + ig^{(0)}(k, E) (-i) \Sigma^I(k, E) ig(k, E)$$

$$g(k, E) = g^{(0)}(k, E) + g^{(0)}(k, E) \Sigma^I(k, E) g(k, E)$$

$\Sigma^I(k, E)$ is a complex object

$$g(k, E) = g^{(0)}(k, E) + g^{(0)}(k, E) \Sigma^I(k, E) g(k, E)$$

is an algebraic equation

$$g(k, E) - g^{(0)}(k, E) \Sigma^I(k, E) g(k, E) = g^{(0)}(k, E)$$

$$g(k, E) = \frac{g^{(0)}(k, E)}{1 - g^{(0)}(k, E) \Sigma^I(k, E)} = \frac{1}{g^{(0)}(k, E)^{-1} - \Sigma^I}$$

$$g(k, E) = \frac{1}{E - \frac{\hbar^2 k^2}{2m} - \Sigma^I(k, E)}$$

$\Sigma^I(k, E)$ complex object related to the interaction of the particle with

$$g(k, E) = \frac{1}{E - \frac{\hbar^2 k^2}{2m} - \sum_I R(k, E) - i \sum_I I(k, E)}$$

$$= \frac{E - \frac{\hbar^2 k^2}{2m} - \sum_I R(k, E) + i \sum_I I(k, E)}{\left[E - \frac{\hbar^2 k^2}{2m} - \sum_I R(k, E) \right]^2 + \left[\sum_I I(k, E) \right]^2}$$

for $\forall k$

$$S_h(k, E) = \frac{1}{\pi} \operatorname{Im} g(k, E) \quad \text{for } E < E_F$$

$$S_h(k, E) = \frac{1}{\pi} \frac{\sum_I I(k, E)}{\left[E - \frac{\hbar^2 k^2}{2m} - \sum_I R(k, E) \right]^2 + \left[\sum_I I(k, E) \right]^2}$$

$$\underline{S_h(k, E) > 0 \Rightarrow \sum_I I(k, E) > 0 \quad E < E_F}$$

$$E > E_F$$

$$S_p(k, E) = -\frac{1}{\pi} \operatorname{Im} g(k, E)$$

$$S_p(k, E) = -\frac{1}{\pi} \frac{\sum_I \operatorname{Im}(k, E)}{\left[E - \frac{\hbar^2 k^2}{2m} - \sum_R(k, E) \right]^2 + \left[\sum_I(k, E) \right]^2}$$

$$S_p(k, E) > 0 \Rightarrow \sum_I(k, E) < 0 \quad E \neq E_F$$

$$\sum_I(k, E) > 0 \quad E < E_F \Rightarrow \forall k \quad \underline{\sum_I(k, E_F) = 0}$$

$$\sum_I(k, E) < 0 \quad E > E_F$$

$$\Sigma^R = \Sigma + \text{diagram with two } \Sigma \text{ bubbles} + \text{diagram with three } \Sigma \text{ bubbles} + \dots$$

$$-i \Sigma^R(k, E) = -i \Sigma(k, E) + (-i) \Sigma(k, E) i g^{(0)}(-i) \Sigma(k, E)$$

$$\Sigma^R(k, E) = \Sigma(k, E) + \Sigma(k, E) g^{(0)}(k, E) \Sigma^R(k, E)$$

one can also write

$$\Sigma^R(k, E) = \Sigma(k, E) + \Sigma(k, E) g(k, E) \Sigma(k, E)$$

$$\Sigma^R = \Sigma + \text{diagram with } \Sigma \text{ and } \Sigma^R \text{ bubbles}$$

$$\Sigma^R = \Sigma + \text{diagram with two } \Sigma \text{ bubbles}$$

Quasi-particle approximation

$$g(k, E) = \frac{1}{E - \frac{\hbar^2 k^2}{2m} - \Sigma^i(k, E)}$$

Expanding the real part of $\Sigma^i(k, E)$

around $\epsilon(k)$

$$\epsilon(k) = \frac{\hbar^2 k^2}{2m} + U(k)$$

$$U(k) \equiv \text{Re } \Sigma^i(k, \epsilon(k))$$

$$W(k) \equiv \text{Im } \Sigma^i(k, \epsilon(k))$$

$$g_{QP}(k, E) = \frac{1}{E - \frac{\hbar^2 k^2}{2m} - U(k) - \left. \frac{\partial \text{Re} \Sigma_1'}{\partial E} \right|_{E=\epsilon(k)} (E - \epsilon(k)) - iW}$$

$$= \frac{1}{E - \epsilon(k) \left(1 - \left. \frac{\partial \text{Re} \Sigma_1'}{\partial E} \right|_{E=\epsilon(k)} \right) - iW}$$

$$= \frac{\left(1 - \left. \frac{\partial \text{Re} \Sigma_1'(k, E)}{\partial E} \right|_{E=\epsilon(k)} \right)^{-1}}{E - \epsilon(k) - i \left(1 - \left. \frac{\partial \text{Re} \Sigma_1'}{\partial E} \right|_{E=\epsilon(k)} \right)^{-1} W}$$

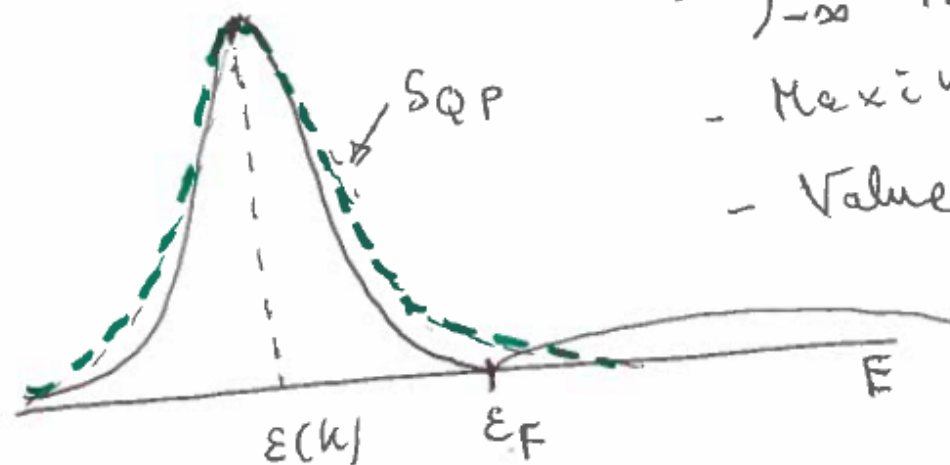

$$Z(k) = \left\{ 1 - \frac{\partial \text{Re} \Sigma^1(k, E)}{\partial E} \right\}^{-1}_{E = \epsilon(k)}$$

Strength of the quasi-particle pole

$$g_{qp}(k, E) = \frac{Z(k) (E - \epsilon(k))}{(E - \epsilon(k))^2 + (Z(k) W(k))^2} + i \frac{Z^2(k) W}{(E - \epsilon(k))^2 + (Z(k) W(k))^2}$$

$$S_{qp}(k, E) = \frac{1}{\pi} \frac{Z^2(k) |W|}{(E - \epsilon(k))^2 + (Z(k) W(k))^2}$$

Lorentzian

$$- \int_{-\infty}^{\infty} S_{qp}(k, E) dE = Z(k)$$

- Maximum at $\epsilon(k)$

- Value at the maximum

$$\frac{1}{\pi} \frac{1}{\text{Im} \Sigma_i(k, \epsilon(k))}$$

- Width

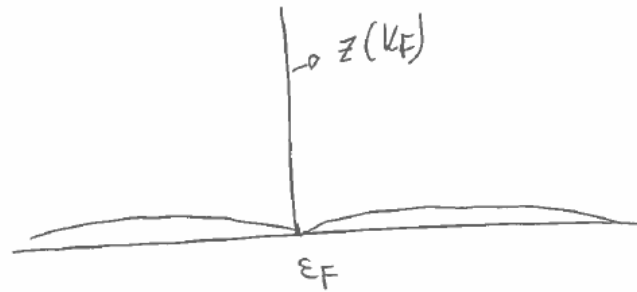

$$\frac{1}{2} \frac{1}{\pi} \frac{1}{W} = \frac{1}{\pi} \frac{Z^2 W}{(E - \epsilon)^2 + Z^2 W^2}$$

$$\Rightarrow E - \epsilon(k) = Z - W$$

The width is $2Z - W$

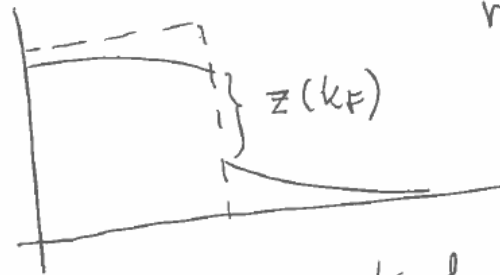

$$\sum_{\mathbf{I}} (k, E = \epsilon_F) = 0 \quad \forall k$$

$$\rightarrow \sum_{\mathbf{I}} (k_F, \epsilon_F) = 0 \quad \text{in this case.}$$

the S_{qp} becomes a $\delta(E - \epsilon_F)$ with strength $Z(k_F)$

That illustrates that the discontinuity of $n(k)$ at k_F is given by $Z(k_F)$

$$n(k) = \int_{-\infty}^{\epsilon_F} dE S_n(k, E)$$

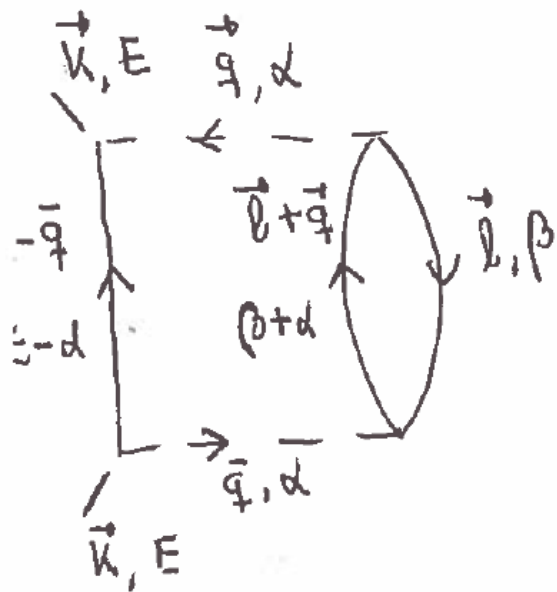

The quasi-particle peak for $k > k_F$, appears at $E > \epsilon_F$ and therefore does not contribute to $n(k)$!

Second order diagram

Not antisymmetric matrix element

I consider the diagram as a contribution to the self-energy (I remove the external legs!)

Remember! The rules for $-i \Sigma^i(k, E)$ are the same as for $ig(k, E)$

$\bar{l} + \bar{q}$
 $\beta + \alpha$

fermionic loop (-1)

$$= \frac{1}{(2\pi)^3} \int d^3 l \int_{-\infty}^{\infty} \frac{d\beta}{2\pi}$$

$$i \left[\frac{\Theta(l - k_F)}{\beta - \varepsilon(l) + i\delta} + \frac{\Theta(k_F - l)}{\beta - \varepsilon(l) - i\delta} \right]$$

$$i \left[\frac{\Theta(|\bar{l} + \bar{q}| - k_F)}{\beta + \alpha - \varepsilon(|\bar{l} + \bar{q}|) + i\delta} + \frac{\Theta(k_F - |\bar{l} + \bar{q}|)}{\beta + \alpha - \varepsilon(|\bar{l} + \bar{q}|) - i\delta} \right]$$

Now I perform the integral over β .

I have 4 combinations

① x ③ Does not contribute, because they have the poles in the same half complex plane.

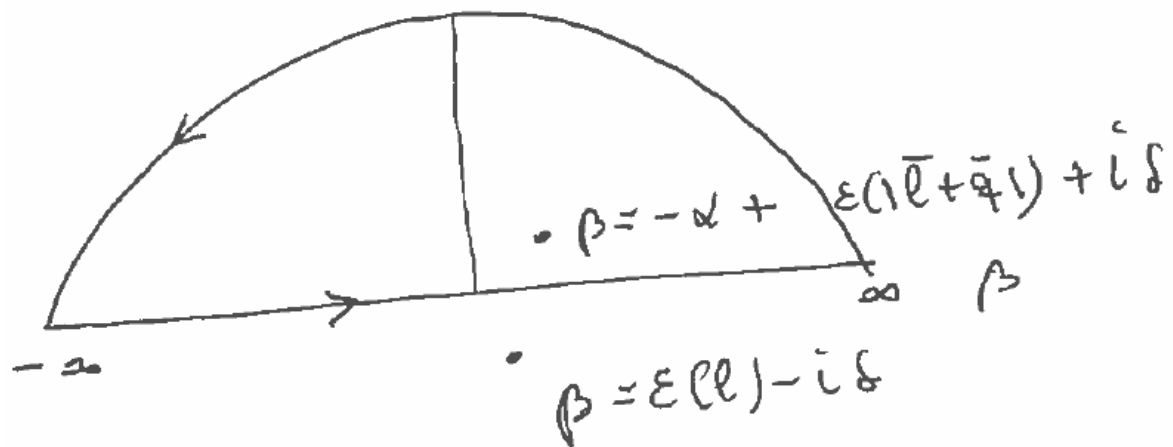

② x ④ The same argument applies in this case.

We have contribution from cases that mixes particle and hole having the poles in different half-planes!

Case ③ x ④, we have poles at

$$\beta = \varepsilon(l) - i\delta \quad \text{below} \quad \text{and} \quad \beta = -\alpha + \varepsilon(l + \bar{q}) + i\delta \quad \text{above}$$

We close the contour in the upper part!

$$\oint = \int + \int_{-\infty}^{\infty} = 2\pi i \sum \text{Res.}$$

but the contribution from $\oint \propto \lim_{R \rightarrow \infty} \left(\frac{d(Re^{i\theta})}{2\pi} \right) \frac{i}{Re^{i\theta}} \frac{i}{Re^{i\theta}}$
 $\propto \lim_{R \rightarrow \infty} \frac{1}{R} \rightarrow 0$

$$\int_{-\infty}^{\infty} \frac{d\beta}{2\pi} i^2 \frac{\Theta(\ell - k_F)}{\beta - \varepsilon(\ell) + i\delta} \frac{\Theta(k_F - |\bar{\ell} + \bar{q}|)}{\beta + \alpha - \varepsilon(|\bar{\ell} + \bar{q}|) - i\delta}$$

$$= i^2 \frac{2\pi i}{2\pi} \lim_{\beta \rightarrow -\alpha + \varepsilon(|\bar{\ell} + \bar{q}|) + i\delta} \frac{\Theta(\ell - k_F)}{\beta - \varepsilon(\ell) + i\delta} \frac{\Theta(k_F - |\bar{\ell} + \bar{q}|)}{(\beta + \alpha - \varepsilon(|\bar{\ell} + \bar{q}|) - i\delta)}$$

$$= -i \frac{\Theta(\ell - k_F) \Theta(k_F - |\bar{\ell} + \bar{q}|)}{-\alpha + \varepsilon(|\bar{\ell} + \bar{q}|) + i\delta - \varepsilon(\ell) + i\delta}$$

$$= \frac{i \Theta(\ell - k_F) \Theta(k_F - |\bar{\ell} + \bar{q}|)}{\alpha - \varepsilon(|\bar{\ell} + \bar{q}|) + \varepsilon(\ell) - i\delta}$$

Contribution ② x ③

$$\int_{-\infty}^{\infty} \frac{d\beta}{2\pi}$$

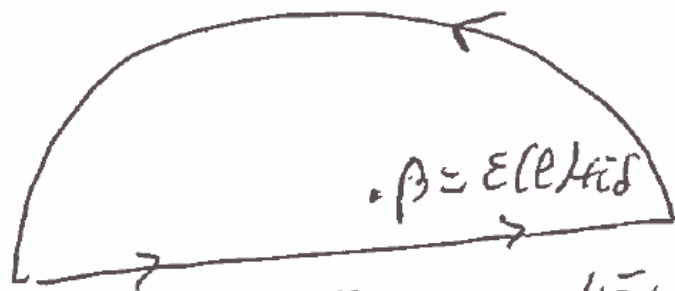

i^2

$$\frac{\theta(k_F - l)}{\beta - \epsilon(l) - i\delta}$$

hole

$$\frac{\theta(|\bar{l} + \bar{q}| - k_F)}{\beta + \alpha - \epsilon(|\bar{l} + \bar{q}|) + i\delta}$$

particle

$$^* \beta = -\alpha + \epsilon(|\bar{l} + \bar{q}|) - i\delta$$

$$= i^2 \frac{2\pi i}{2\pi} \lim_{\beta \rightarrow \epsilon(l) + i\delta}$$

$$\frac{\cancel{\beta - \epsilon(l) - i\delta}}{\cancel{\beta - \epsilon(l) - i\delta}} \frac{\theta(k_F - l) \theta(|\bar{l} + \bar{q}| - k_F)}{\beta + \alpha - \epsilon(|\bar{l} + \bar{q}|) + i\delta}$$

$$= -i \frac{\theta(k_F - l) \theta(|\bar{l} + \bar{q}| - k_F)}{\epsilon(l) + \alpha - \epsilon(|\bar{l} + \bar{q}|) + i\delta}$$

Therefore, now we perform the integration over momentum

$$\begin{array}{c} \bar{l} + \bar{q} \\ \beta + k \end{array} \begin{array}{c} \uparrow \\ \downarrow \end{array} \begin{array}{c} \vec{l}, \beta \end{array} = (-1)^2 \begin{array}{c} \nearrow \\ \searrow \end{array} \begin{array}{c} \text{fermionic} \\ \text{loop} \end{array} \begin{array}{c} \text{new} \\ \text{overlap} \end{array}$$

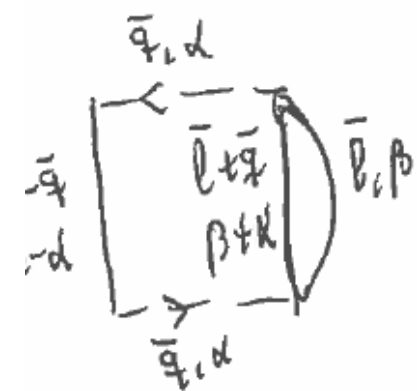

$$\left[\frac{1}{(2\pi)^3} \int d^3 l \right]$$

$$\frac{i \Theta(l - k_F) \Theta(k_F - |\bar{l} + \bar{q}|)}{d - \varepsilon(|\bar{l} + \bar{q}|) + \varepsilon(l) - i\delta}$$

$$- \frac{1}{(2\pi)^3} \int d^3 l$$

$$\frac{i \Theta(k_F - l) \Theta(|\bar{l} + \bar{q}| - k_F)}{d + \varepsilon(l) - \varepsilon(|\bar{l} + \bar{q}|) + i\delta}$$

Now we add the integration over d^3q and over $d\omega$. Consider just the term corresponding to $\Theta(k_F - \ell) \Theta(|\bar{\ell} + \bar{q}| - k_F)$

two interaction
 \downarrow
 $= (-i)^2 i$
 propagator associated to $\bar{k} - \bar{q}$
 spin propagator
 ph. propagator

$$\frac{1}{(2\pi)^3} \int d^3q V_q^2 \frac{1}{(2\pi)^3} \int d^3\ell \int \frac{d\omega}{2\pi} \left[\frac{\Theta(|\bar{k} - \bar{q}| - k_F)}{E - \omega - E(|\bar{k} - \bar{q}|) + i\delta} + \frac{\Theta(k_F - |\bar{k} - \bar{q}|)}{E - \omega - \dots - i\delta} \right]$$

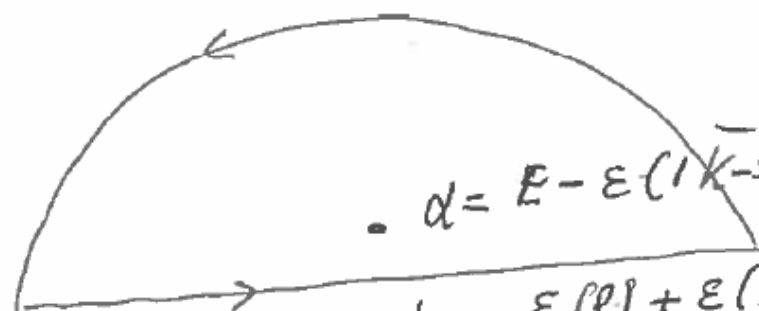

new energy integration

$$\frac{\Theta(k_F - \ell) \Theta(|\bar{\ell} + \bar{q}| - k_F)}{\omega + E(\ell) - E(|\bar{\ell} + \bar{q}|) + i\delta}$$

1 contribution

When I integrate over $d\bar{\epsilon}$ I get con-
only from the particle part of the propagator
associated to $\bar{k}-\bar{q}$.

↙ pole associated to $g^{(0)}(|\bar{k}-\bar{q}|, E-d)$
particle part

• $d = E - \epsilon(|\bar{k}-\bar{q}|) + i\delta$

• $d = -\epsilon(\ell) + \epsilon(|\bar{\ell}+\bar{q}|) - i\delta$

Pole associated to
the propagator

The result of the integral =

$$\frac{2\pi i}{2\pi} \lim_{d \rightarrow E - \epsilon(|\bar{k}-\bar{q}|) + i\delta} \frac{d - E + \epsilon(|\bar{k}-\bar{q}|) - i\delta}{E - d - \epsilon(|\bar{k}-\bar{q}|) + i\delta} \frac{1}{d + \epsilon(\ell) - \epsilon(|\bar{\ell}+\bar{q}|) + i\delta}$$

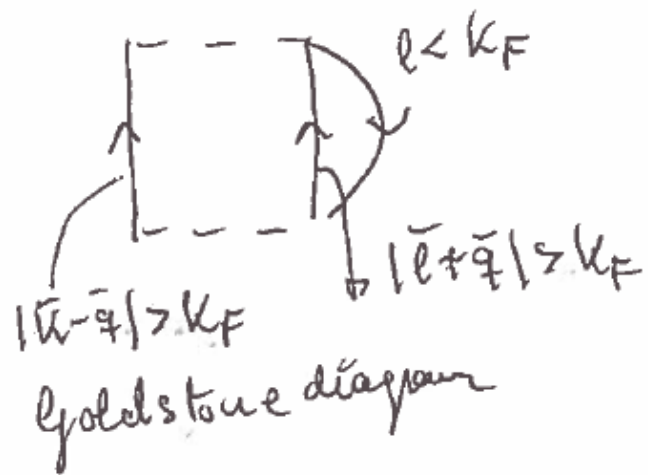

$$= -i \frac{\Theta(k_F - \ell) \Theta(|\bar{\ell}+\bar{q}| - k_F) \Theta(|\bar{k}-\bar{q}| - k_F)}{E + \epsilon(\ell) - \epsilon(|\bar{\ell}+\bar{q}|) - \epsilon(|\bar{k}-\bar{q}|) + i\delta}$$

Therefore the contribution of this piece $(2p \pm k)$ is

$$-i \sum_l (2p \pm k) (k, E) = (-i)^2 \times i^3 (-1) \frac{1}{(2\pi)^3} \int d^3 q \frac{1}{(2\pi)^3} \int d^3 \ell$$

$$|V_q|^2 \Theta$$

$$= -2i \int \frac{d^3 q}{(2\pi)^3} \int \frac{d^3 \ell}{(2\pi)^3} |V_q|^2 \frac{\Theta(k_F - \ell) \Theta(|\bar{\ell} + \bar{q}| - k_F) \Theta(|\bar{k} - \bar{q}| - k_F)}{E + \varepsilon(\ell) - \varepsilon(|\bar{\ell} + \bar{q}|) - \varepsilon(|\bar{k} - \bar{q}|) + i\delta}$$

$$\underline{\text{Im} \sum_l 2p \pm h} = \underset{\substack{\text{spin} \\ \text{to } \delta}}{-2\pi} \underset{\substack{\text{associated} \\ \text{to } \delta}}{\int \frac{d^3 q}{(2\pi)^3} \int \frac{d^3 l}{(2\pi)^3}} |V_q|^2 \delta(E + \epsilon(l) - \epsilon(|\vec{l} + \vec{q}|) - \epsilon(|\vec{k} - \vec{q}|))$$

- ⊛ The imaginary part of $\sum_l 2p \pm h$ is negative
- * Contribution for $E > \epsilon_F$ which is the minimum value of E that produces imaginary part for a given k

$$E = \epsilon(|\bar{l} + \bar{q}|) - \epsilon(l) + \epsilon(|\bar{k} - \bar{q}|)$$

$$l < k_F \quad |\bar{l} + \bar{q}| > k_F \quad |\bar{k} - \bar{q}| > k_F$$

Assume $\epsilon(k)$ an increasing function of k

$$\min \text{ of } E = \min(\epsilon(|\bar{l} + \bar{q}|)) - \max \epsilon(l) + \min(\epsilon(|\bar{k} - \bar{q}|))$$

$$= \epsilon_F$$

$$\Rightarrow \text{Im} \sum_i 12p \pm h(k, E) = 0 \quad E < \epsilon_F$$

$$< 0 \quad E > \epsilon_F$$

So, the single-particle momentum gets mix with 2p±h configuration.

One can show that $\text{Im} \sum_i 12p \pm h(k, E)$ close to the Fermi surface behaves like

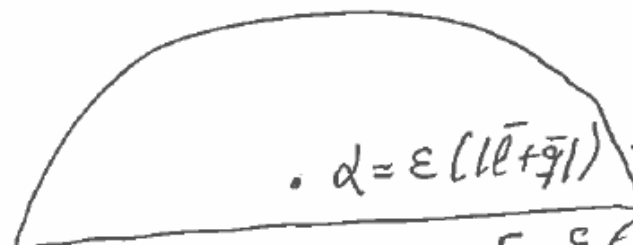

$$\text{Im} \sum_i 12p \pm h(k, E) \propto (E - \epsilon_F)^2 \quad E > \epsilon_F$$

Let's look at the other contribution, that we will call 2h1p

$$(-i)^2 \times i^3 \times (-1) \int \frac{d^3 q}{(2\pi)^3} V_q^2 \int \frac{d^3 \ell}{(2\pi)^3} \int \frac{d\alpha}{2\pi}$$

$$\frac{\Theta(\ell - k_F) \Theta(k_F - |\bar{\ell} + \bar{q}|)}{\alpha - \epsilon(|\bar{\ell} + \bar{q}|) + \epsilon(\ell) - i\delta} \left[\frac{\Theta(|\bar{k} - \bar{q}| - k_F)}{\bar{k} - \alpha - \epsilon(|\bar{k} - \bar{q}|) + i\delta} + \frac{\Theta(k_F - |\bar{k} - \bar{q}|)}{E - \alpha - \epsilon(|\bar{k} - \bar{q}|) - i\delta} \right]$$

we get contribution only from the hole part of the propagator associated to $\bar{k} - \bar{q}$.

• $\alpha = \epsilon(|\bar{\ell} + \bar{q}|) - \epsilon(\ell) + i\delta$
 • $\alpha = E - \epsilon(|\bar{k} - \bar{q}|) - i\delta$

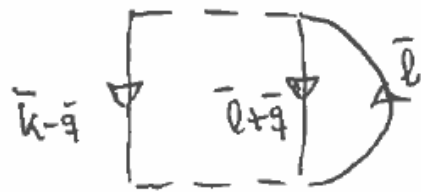

$$\frac{2\pi i}{2\pi} \lim_{\delta \rightarrow 0} \frac{\alpha - \varepsilon(|\bar{\ell} + \bar{q}|) - \varepsilon(\ell) + i\delta}{\alpha - \varepsilon(|\bar{\ell} + \bar{q}|) + \varepsilon(\ell) - i\delta}$$

$$\frac{\theta(\ell - k_F) \theta(k_F - |\bar{\ell} + \bar{q}|) \theta(k_F - |\bar{k} - \bar{q}|)}{E - \alpha - \varepsilon(|\bar{k} - \bar{q}|) - i\delta}$$

$$= i \frac{\theta(\ell - k_F) \theta(k_F - |\bar{\ell} + \bar{q}|) \theta(k_F - |\bar{k} - \bar{q}|)}{E - \varepsilon(|\bar{\ell} + \bar{q}|) + \varepsilon(\ell) - \varepsilon(|\bar{k} - \bar{q}|) - i\delta}$$

$$-i \sum_{\mathbf{q}} V_{\mathbf{q}}^2 \int \frac{d^3 \ell}{(2\pi)^3} \int \frac{d^3 \bar{q}}{(2\pi)^3} \frac{\theta(\ell - k_F) \theta(k_F - |\bar{\ell} + \bar{q}|) \theta(k_F - |\bar{k} - \bar{q}|)}{E + \varepsilon(\ell) - \varepsilon(|\bar{\ell} + \bar{q}|) - \varepsilon(|\bar{k} - \bar{q}|) - i\delta}$$

$$\text{Im} \sum^{12h \pm p} = 2\pi \int \frac{d^3 q}{(2\pi)^3} \int \frac{d^3 l}{(2\pi)^3} |V_q|^2 \delta(E - \epsilon(l) - \epsilon(|\bar{l} + \bar{q}|) - \epsilon(|\bar{k} - \bar{q}|))$$

$$|\bar{l} + \bar{q}| < k_F$$

$$|\bar{k} - \bar{q}| < k_F$$

$$l > k_F$$

$$\text{Im} \sum^{12h \pm p}(k, E) > 0$$

One gets imaginary part for $E < E_F$

$$E = \epsilon(|\bar{l} + \bar{q}|) + \epsilon(|\bar{k} - \bar{q}|) - \epsilon(l)$$

Max E ?

$$|\bar{l} + \bar{q}| < k_F$$

$$|\bar{k} - \bar{q}| < k_F \quad l > k_F$$

$$= E_F$$

Hartree - Fock

$$\text{Diagram with two vertical lines} = \frac{1}{\text{Diagram with one vertical line}^{-1} - (\text{Diagram with a circle and a vertical line} + \text{Diagram with a circle and a horizontal line})}$$

If we recalculate the self-energy diagrams with $\text{Diagram with two vertical lines}$ at the HF level I get the same contribution.

$$\text{Diagram with a circle and a vertical line} \underset{\text{HF}}{=} \text{Diagram with a circle and a vertical line} = \text{Diagram with a circle and a vertical line} \underset{g^{(0)}}{=}$$

because

$$\oint dE g^{(0)}(k, E) = 2\pi i \Theta(k_F - k)$$

$$\oint dE g^{\text{HF}}(k, E) = 2\pi i \Theta(k_F - k)$$

Dressing the lines (with care!)

$$\text{Dashed box with vertical line and loop} = \text{Dashed box with vertical line and double loop} + \text{Dashed box with double loop and vertical line}$$

Next lecture

Now we are ready to include the ladder diagrams in the self-energy.

We will include both propagation of particles and holes at all orders.

Dressing the intermediate states in the T-matrix with the full spectral functions

This defines a self-consistent problema between the determination of the scattering of the dressed particles and the dress of the particles.

On one side the interaction affects the properties of the particles : dressing through the self-energy (spectral functions) and at the same time affects the effective interaction between the dressed particles.

The minimal thermodynamically consistent approximation is to consider the ladder approach.

Propagating only particles and under certain approaches for the intermediate propagators we can recover the BHF approach.
